Chapter One : The Concept of the IMAP Protocol4

First: The importance of the IMAP protocol5

Second: The difference between the IMAP protocol and the rest of the protocols followed in email 22

Chapter Two : How the IMAP Protocol Works26

First: IMAP protocol and email organization and protection 27

Second: The mechanism for accessing email and the IMAP protocol 30

Chapter 1

The Concept of the IMAP Protocol

First: The Importance of the IMAP Protocol

**Second: The Difference Between IMAP and
Other Email Protocols**

The importance of IMAP protocol

It is a protocol for accessing messages over the Internet, which is a program used to retrieve incoming email, by storing mail messages on a remote server away from users, where it allows them to view and manage messages as if they were stored on their personal device.

The IMAP protocol enables users to organize email messages in folders, mark messages for follow-up, and save message drafts on the server. Users also benefit from the features of this protocol by displaying read or unread messages.

IMAP acts as an intermediary between the email server and email users, by reading messages through this protocol outside the server without the need to download or store mail messages on their personal devices, which means that email is not linked to a specific device, but users can access it from anywhere in the world using different devices such as desktop computers, laptops, smartphones, and tablets.

Advantages of IMAP protocol:

Access to email messages from multiple devices.

Supporting email functionalities, such as search and sorting.

Organize email messages.

Multiple users can share a mailbox.

Quick and efficient access to email messages.

Advantages of IMAP protocol:

Displaying unread emails in the inbox.

Eliminating the need to re-download messages when transitioning between devices as they are stored remotely.

Ideal for those who need to access their email while traveling or using different devices.

Directly handling messages on the email server, instead of downloading them to the user's device.

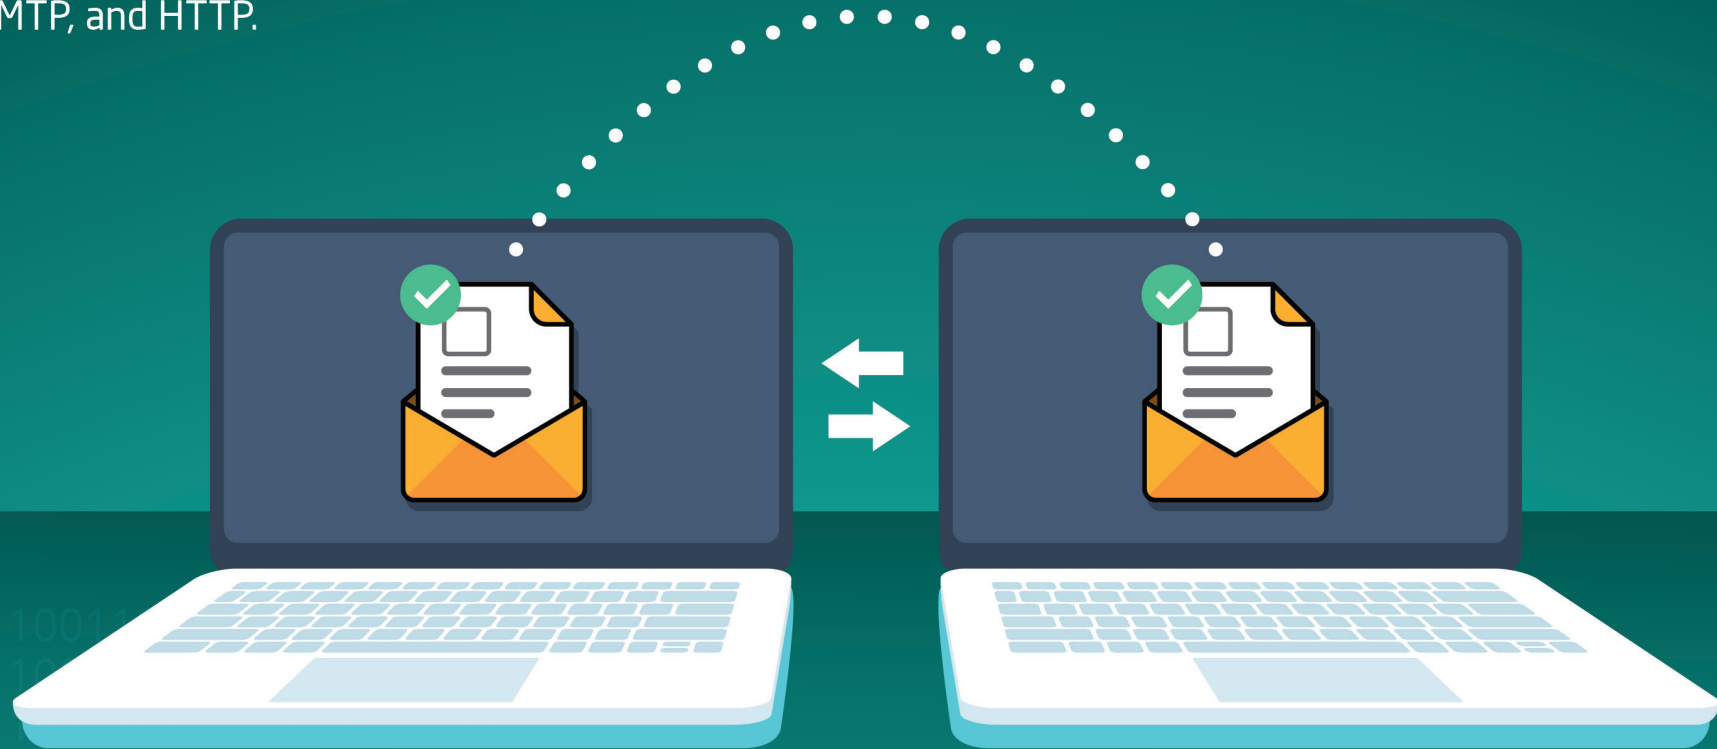

In IMAP protocol, providing email presence on the server ensures higher security in case the user loses or damages their device.

The background consists of large, overlapping geometric shapes in teal and light gray. A large teal circle is centered on the page, containing white text. The text is arranged in five lines, centered within the circle.

**The difference between
IMAP protocol and the rest
of the protocols followed in
email**

Email protocol

- An email protocol is a program that connects one computer to another to exchange email messages.
- When sending an email, there are three elements in the exchange equation (two devices + server); One of the devices sends the email to the other (the recipient), while the mail server's task is to store the messages and allow the receiving device to access and download them when needed.
- There are four different mail protocols, in terms of features, uses and importance, which are: POP3, IMAP, SMTP, and HTTP.

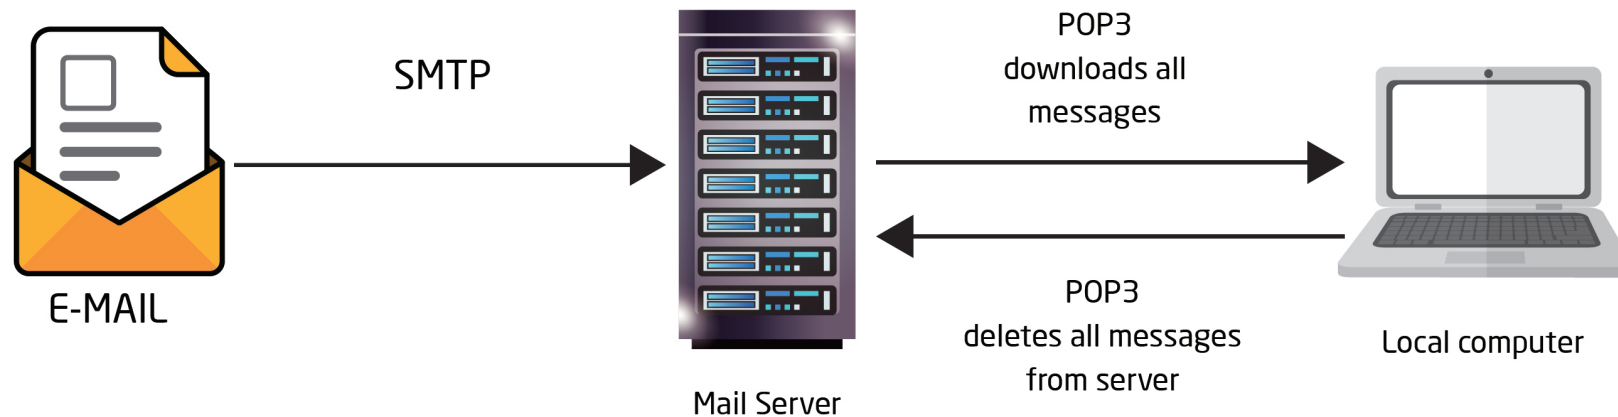

Illustration of how POP3 works.

POP3 protocol

- POP3 is a simple and old protocol designed for use on a single computer, supporting only one-way email synchronization, which means allowing users to download email messages from the server to the client only on their own computer.
- POP3 enables email users with temporary internet access to access their messages, read them, or compose new messages or reply to them even if they are not connected to the internet, and then send them when they reconnect to the internet. Examples of this type of email protocol include Yahoo.

Disadvantages of POP3 protocol

Marking messages as read on multiple devices, which means that every time the user downloads a message from his email on a different device, it will appear as a new message, even if they have already read it on another device.

1

Incapable of synchronizing sent items.

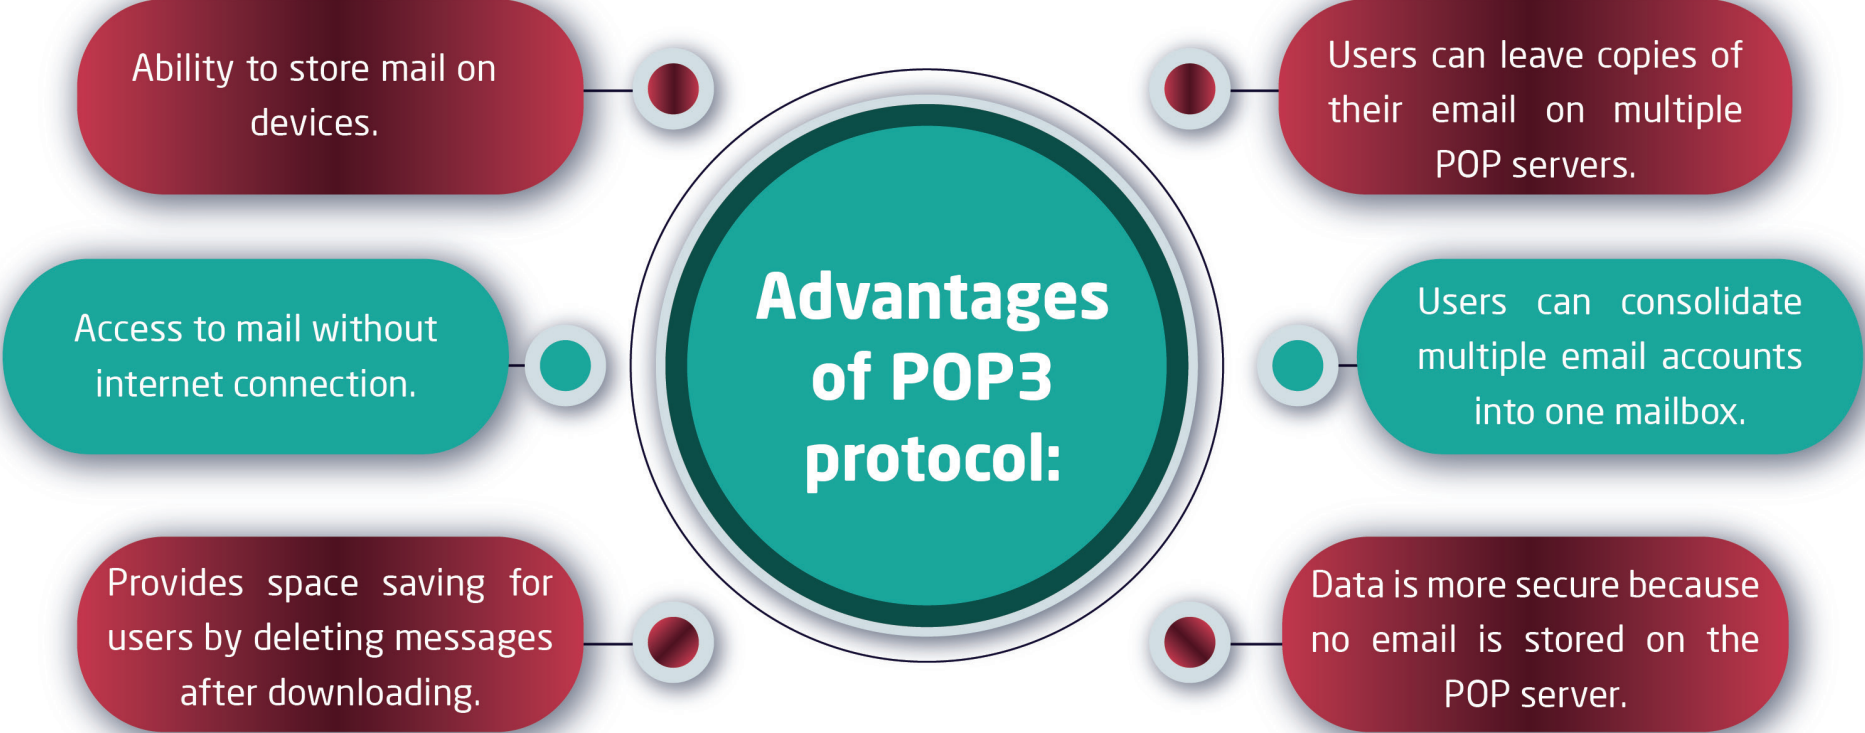

2

Users must continually set up their device to periodically check their email server to recognize newly received messages.

3

Users need to manually create items like personal folders or adjust settings individually on all devices.

4

Advantages of POP3 protocol:

Ability to store mail on devices.

Users can leave copies of their email on multiple POP servers.

Access to mail without internet connection.

Users can consolidate multiple email accounts into one mailbox.

Provides space saving for users by deleting messages after downloading.

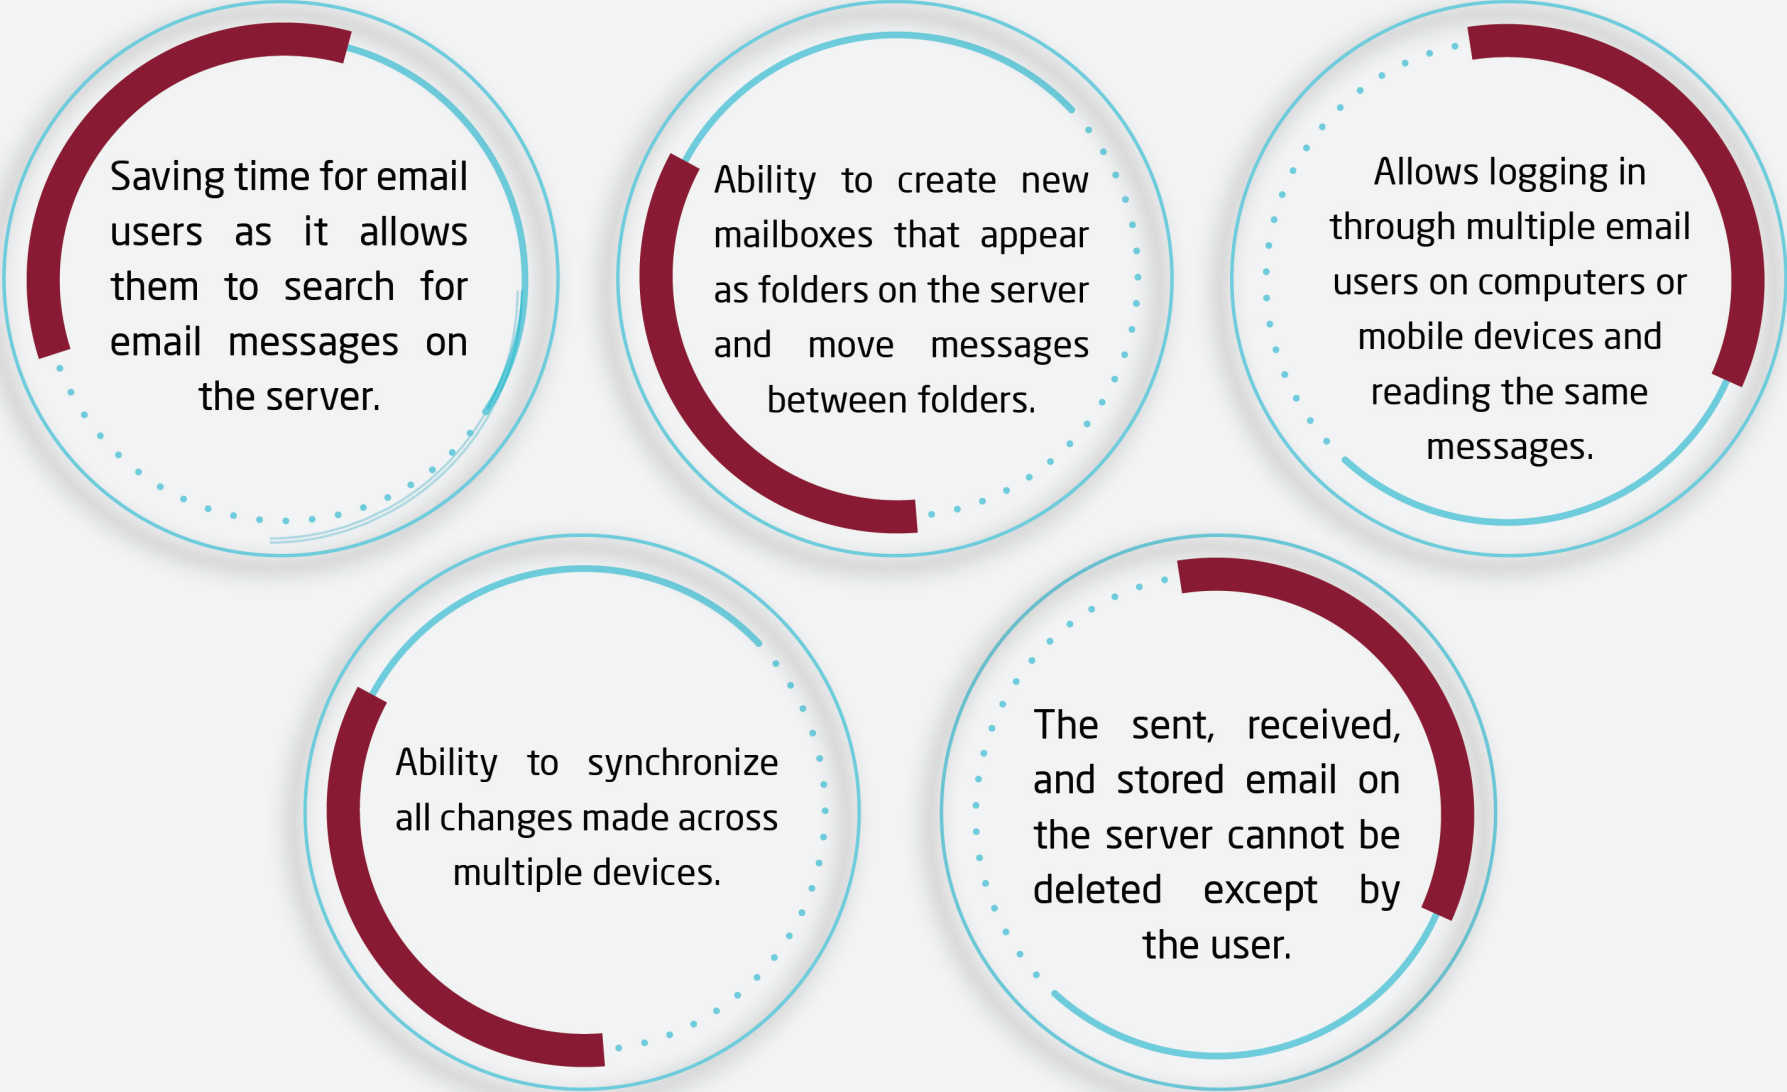

Data is more secure because no email is stored on the POP server.

IMAP (Internet Message Access Protocol)

The IMAP protocol supports users' access to their email messages, whether they are connected to the internet or not, similar to POP3 protocol. It also allows users to download email messages to their personal devices while keeping a copy on the server, and that copy available on the server is considered the original version of the message.

Advantages of IMAP protocol:

Saving time for email users as it allows them to search for email messages on the server.

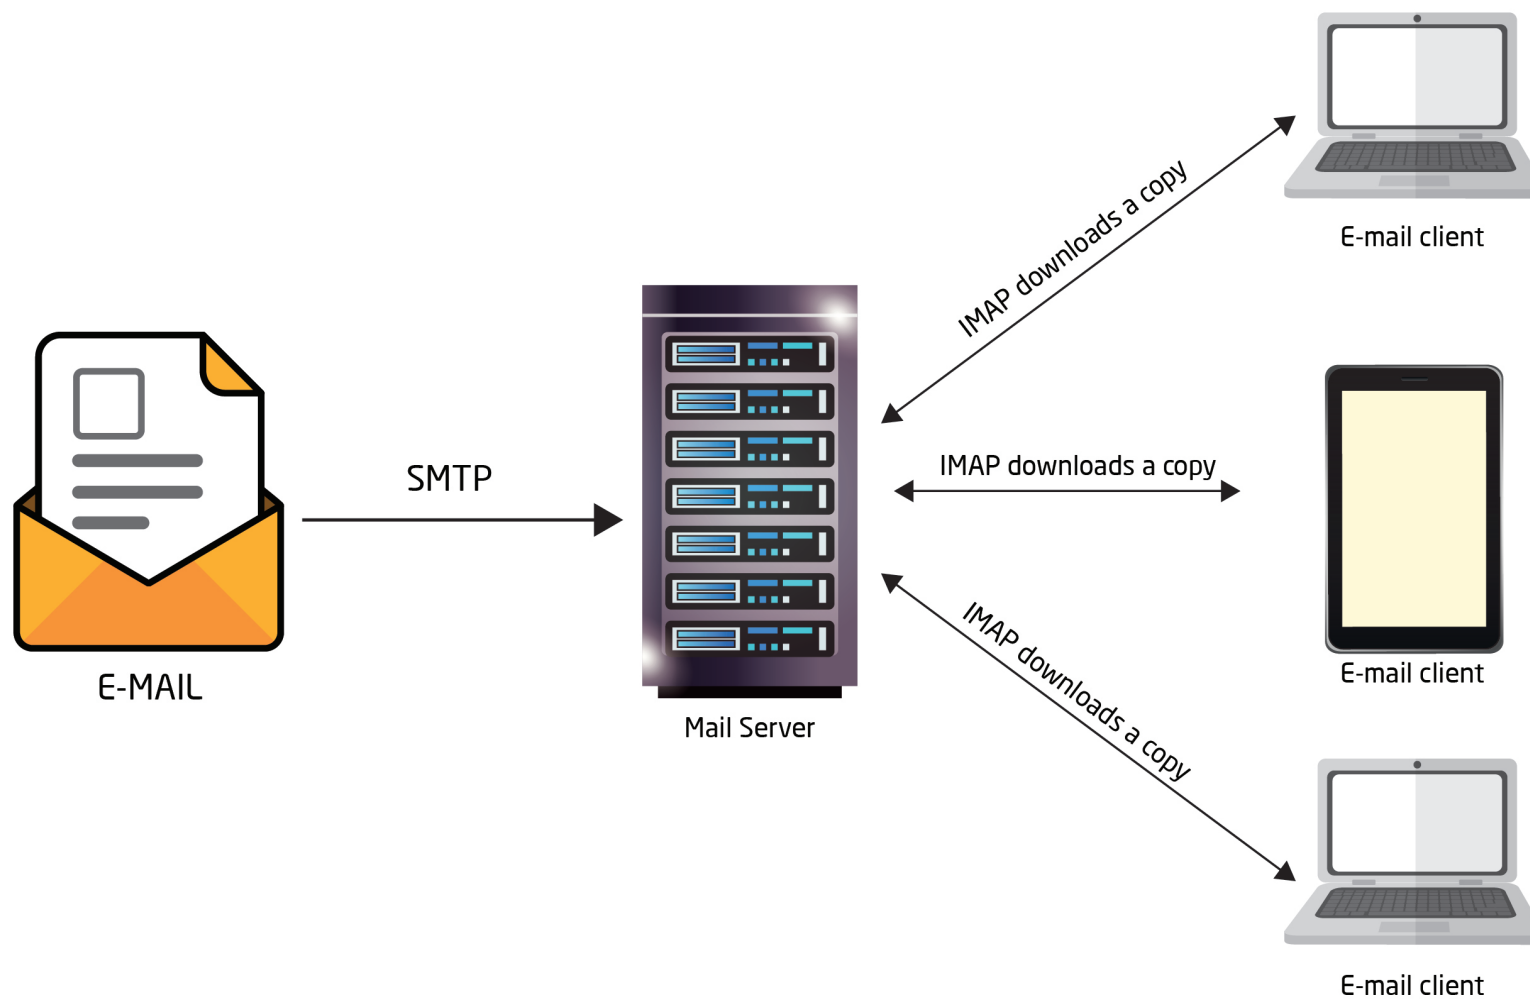

Ability to create new mailboxes that appear as folders on the server and move messages between folders.

Allows logging in through multiple email users on computers or mobile devices and reading the same messages.

Ability to synchronize all changes made across multiple devices.

The sent, received, and stored email on the server cannot be deleted except by the user.

Illustration of how IMAP works.

Disadvantages of IMAP protocol:

- Limiting message storage to 200 MB or 500 MB unless you purchase more professional email services.
- Storing all messages on the server increases the chances of E-mail theft and unauthorized access, especially if the user's password is insecure or weak.

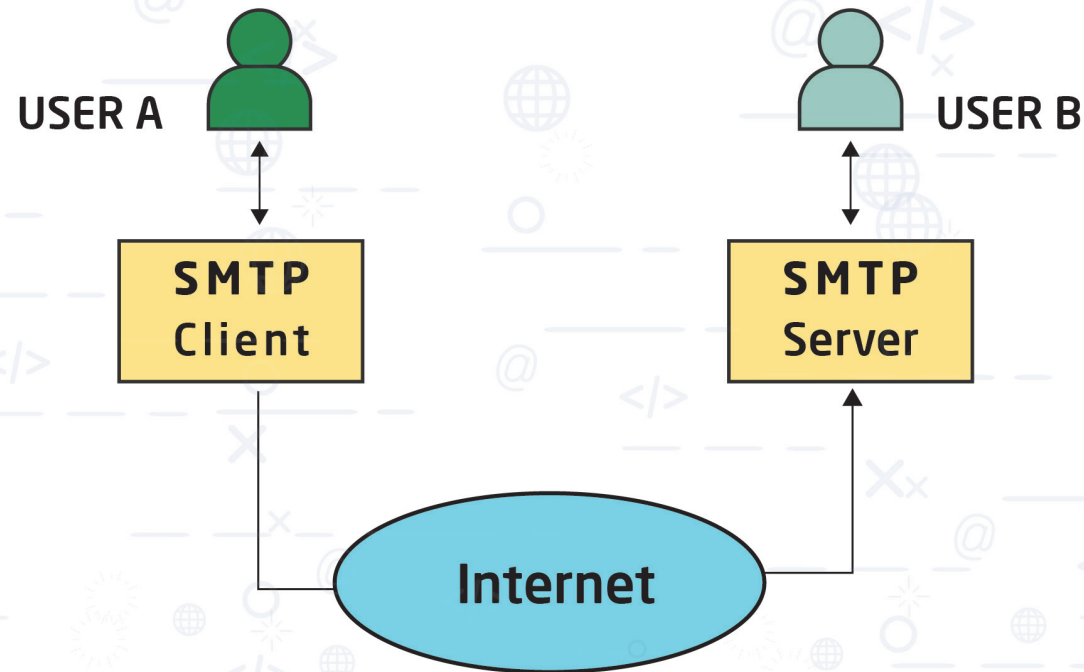

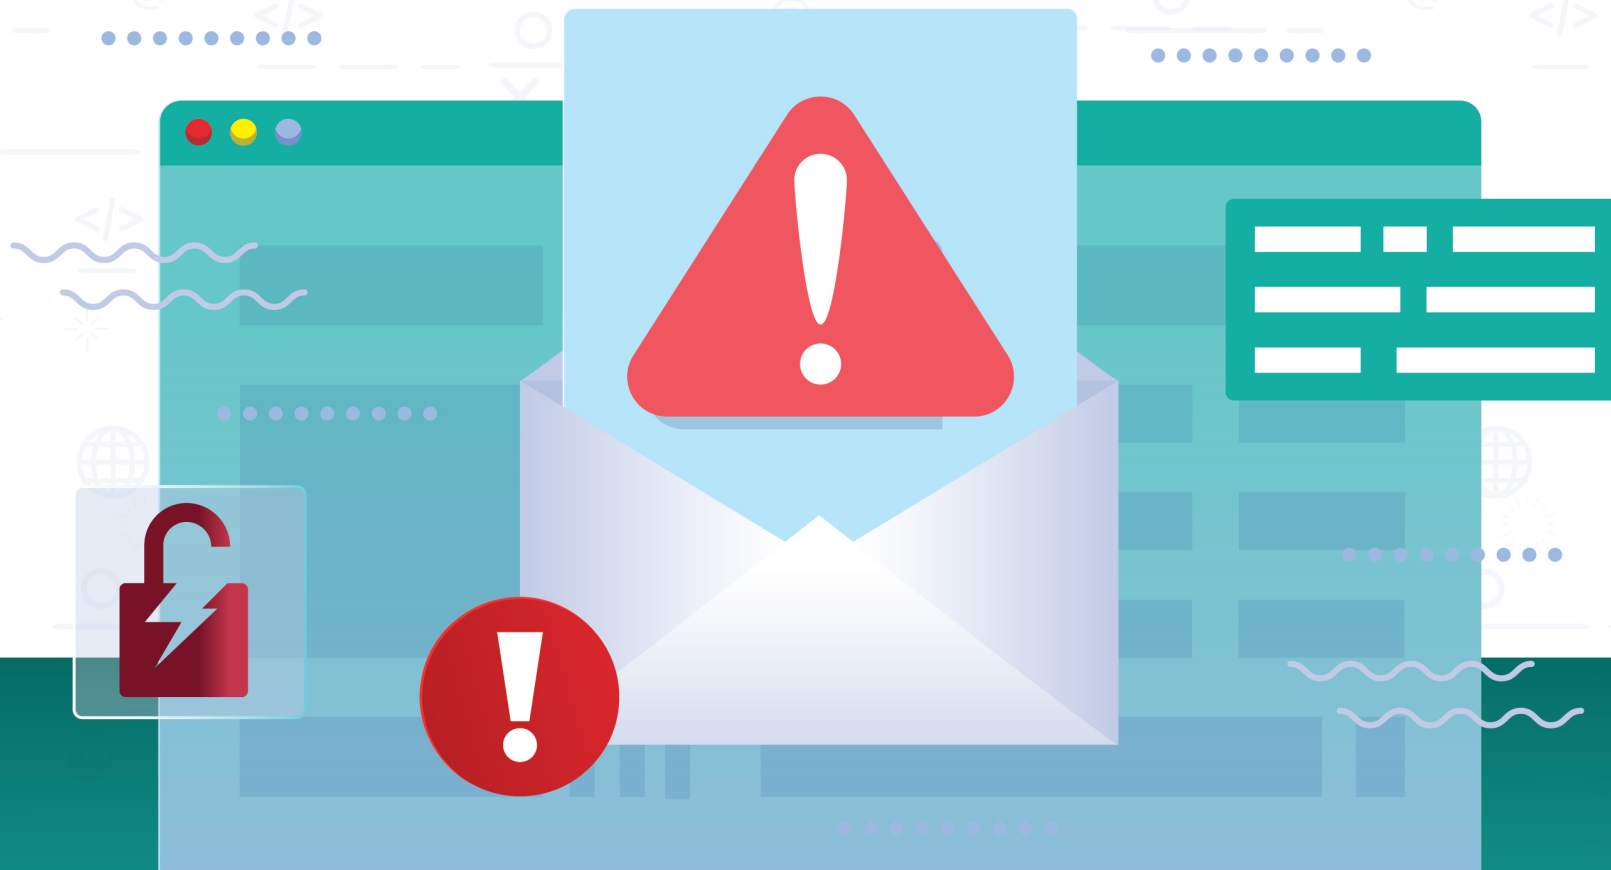

Illustration of how SMTP works.

SMTP (Simple Mail Transfer Protocol)

It is a simple text-based protocol that works well when devices are connected to each other, and it only specializes in sending email messages unlike POP3 and IMAP protocols, which provide message retrieval from the server, and this is the reason behind the decline in reliance on it, and to overcome this drawback SMTP protocol provides the possibility of placing email messages in a queue on the server.

Disadvantages of SMTP

- 1 **Lack of security feature:** as it is easy to hack.
- 2 **Server restrictions:** The protocol sets several rules for hosting, as well as restrictions for internet connection.

Advantages of SMTP

- 1 Ability to perform statistics from the sent messages to create statistical reports for sent newsletters.
- 2 SMTP Enables synchronization of Smarthost server.

Hypertext Transfer Protocol (HTTP)

HTTP plays an important role by allowing internet browser users to access their mail messages, whether for sending or receiving. And among the most famous applications that use this protocol are Hotmail and Yahoo. HTTP (Hypertext Transfer Protocol) is used to access data on the World Wide Web (www), where it can be used to transfer data whether as plain text or audio or video and more. This protocol is characterized by its efficiency in moving between documents quickly, as well as delivering messages instantly.

There are two types of HTTP messages:

1

Request message

The user sends a message consisting of a request line, headers, and sometimes text.

2

Response message

The server responds to the user with a message consisting of a status line, headers, and sometimes text.

Connectionless protocol.

Both the user and the server know each other only during the current request, and therefore neither of them retains information about the requests.

Reducing access time in communication.

Storing all HTTP pages within what is known as “page cache memory” on the internet upon first visit, which makes loading content faster when visiting pages again.

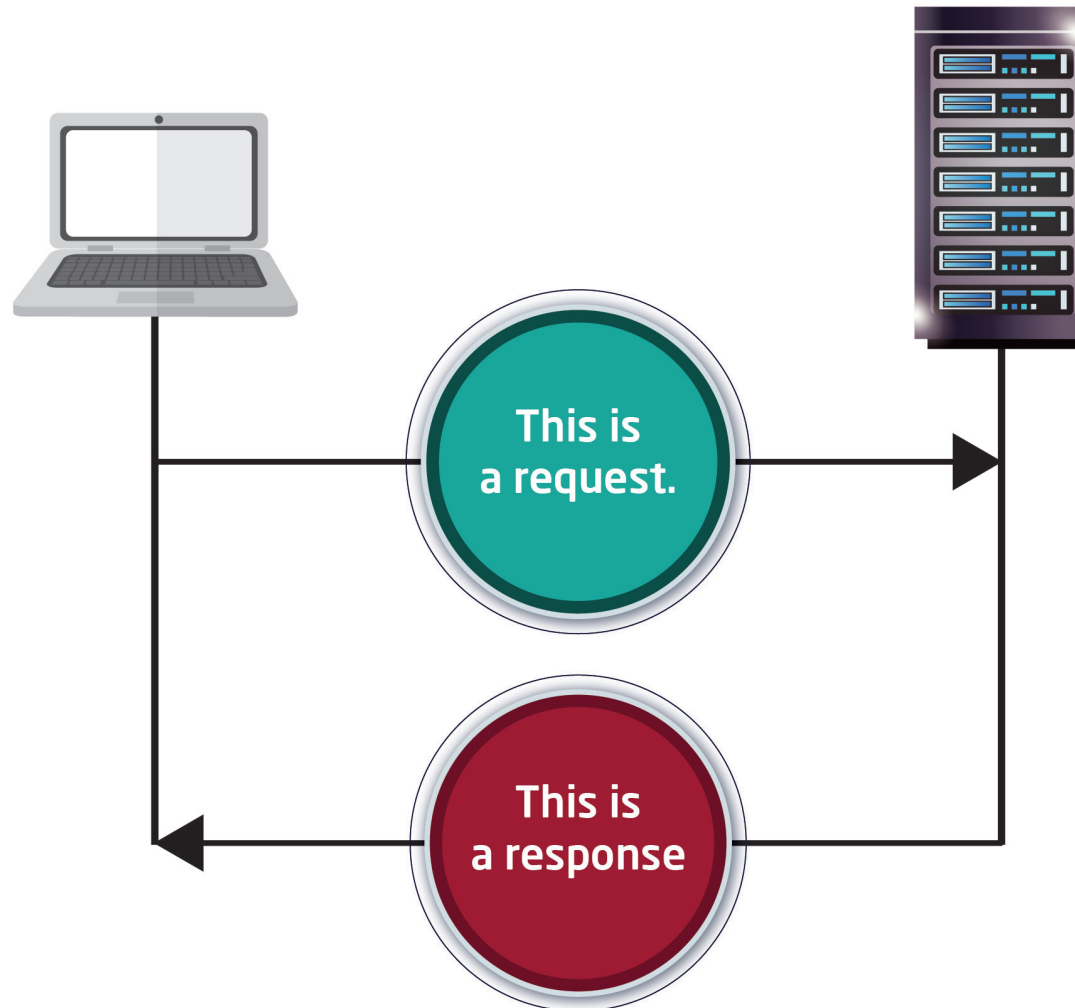

Data can be sent as long as both the user and the server know how to interact with the data content.

HTTP uses an advanced system for addressing files, making it easy to identify them on the web, which makes using the public easier with the internet.

It provides the ability to download plug-ins and display relevant data, such as flash players and Acrobat reader (PDF files).

Advantages of HTTP protocol:

An illustration of how the request and response are exchanged between the user and the server.

Disadvantages of HTTP protocol:

Data integrity: Due to the absence of encryption methods in the HTTP protocol, the chances of content manipulation increase, making it an insecure choice for data.

1

Data privacy: One of the disadvantages of HTTP is the issue of privacy, where any intruder can intercept the request and display the content on the web page, as well as collect confidential information such as username and password.

2

HTTP requires multiple connections to transfer a web page, which means more administrative costs.

3

Clients fail to take actions to close the connection despite receiving all the required data from HTTP.

4

HTTP consumes more energy due to its increased usage of system resources; therefore, it is not the best option for Internet of Things devices.

5

Chapter Two

How IMAP Protocol Works

**IMAP Protocol and Email
Organization and Protection**

The main purpose of the IMAP protocol

Is to provide users with a convenient and efficient way to access, manage and organize email messages stored on the mail server.

How does IMAP protocol work?

Connecting to the server: To access the user's email, they must connect to their specific email server.

01

Authentication: In this step, the user inputs their contact information (username and password) to the server, which verifies and authorizes these credentials

02

Synchronization: Once the user accesses their email, they retrieve the list of messages and folders from the mail server, allowing him to synchronize between both parties.

03

Accessing messages: When the user requests to read email messages, the IMAP protocol begins transferring only the necessary parts of the email.

04

Processing messages: The user can perform several operations on their emails.

05

Disconnecting: The connection with the server is cut off once the user finishes using the mail.

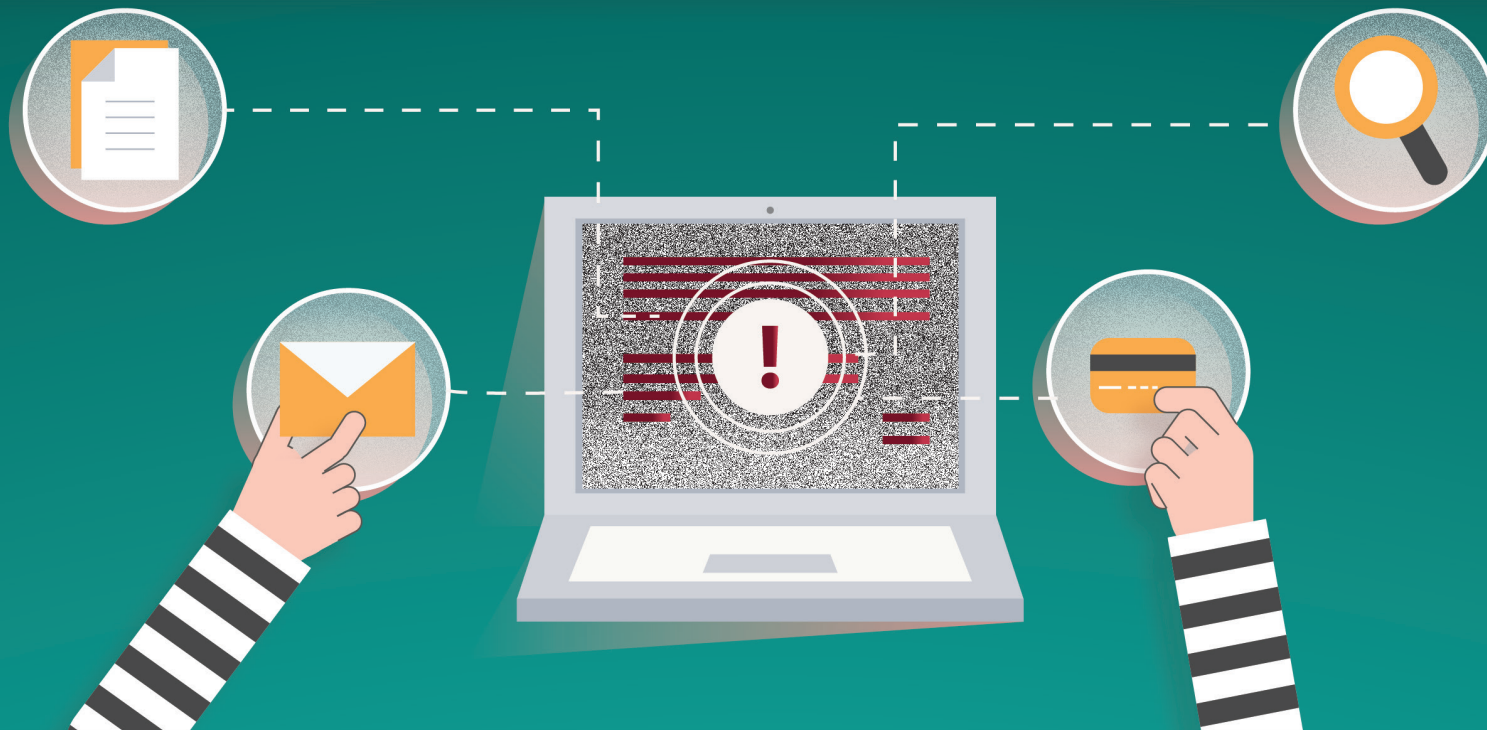

06

Security concerns for IMAP

Despite the advantages of IMAP protocol, there are some security concerns that may occur through it, such as:

1 Increased risk of sensitive information exposure to eavesdropping or external attacks.

2 In case of a breach, intruders' gaining access to messages becomes inevitable, leading to privacy violation and data theft. Hence, it's advisable to employ two-factor authentication should be used, along with strong and different passwords that are difficult to guess.

The background features a large, dark maroon circle in the center. This circle is partially overlapped by two teal-colored shapes: a large triangle on the left and a smaller triangle on the right. The remaining space is filled with a light gray color, creating a geometric, abstract design.

Mechanism of accessing email messages and IMAP protocol

How email works

Email

Email is an electronic communication method for sending and receiving messages over the internet, currently the most common form of communication. It features functionalities like synchronization and security, as well as features related to spam emails.

Email consists of:

1

Sender: The person who sends an email containing information with the aim of delivering it to the recipient.

2

Recipient: The receiver who obtains the information sent by the sender via email.

3

Email address: It is the address on which the sender and recipient communicate similar to receiving physical mail at home.

4

Mailer: This program ensures the possibility of reading, writing, managing and deleting emails in email services such as Gmail, Outlook and others.

5

Mail server: It is responsible for sending, receiving, managing and recording all data that is done by its own email programs, as well as processing them

6

SMTP: It is a simple mail transfer protocol that uses the Internet to send and receive messages.

7

Following this, the Internet Message Access Protocol (IMAP) is used by the email user (the recipient) to retrieve the sender's message from the mail server and place it in his inbox.

How email works

1

When the sender uses mail, it is redirected to Simple Mail Transfer Protocol.

2

The protocol stores the sent email on the server for later transfer using any of the basic protocols POP or IMAP.

3

In case the recipient has a different domain address (for example, the sender's domain Gmail differs from the recipient's domain Hotmail), then SMTP protocol connects with Domain Name Server (DNS) which communicates with the other address used by the receiver and then the sender's SMTP connects with the recipient's SMTP to deliver the email.

4

If both SMTPs of sender and recipient are unable to communicate with each other due to internet issues, then the email is placed in a specific SMTP queue until the problem is resolved. However, if the issue persists, the message is returned to the sender.

5

When the recipient uses the POP protocol, the received email is deleted from the web server. However, if using IMAP, the email is stored on the web server for the recipient to manage at any time.

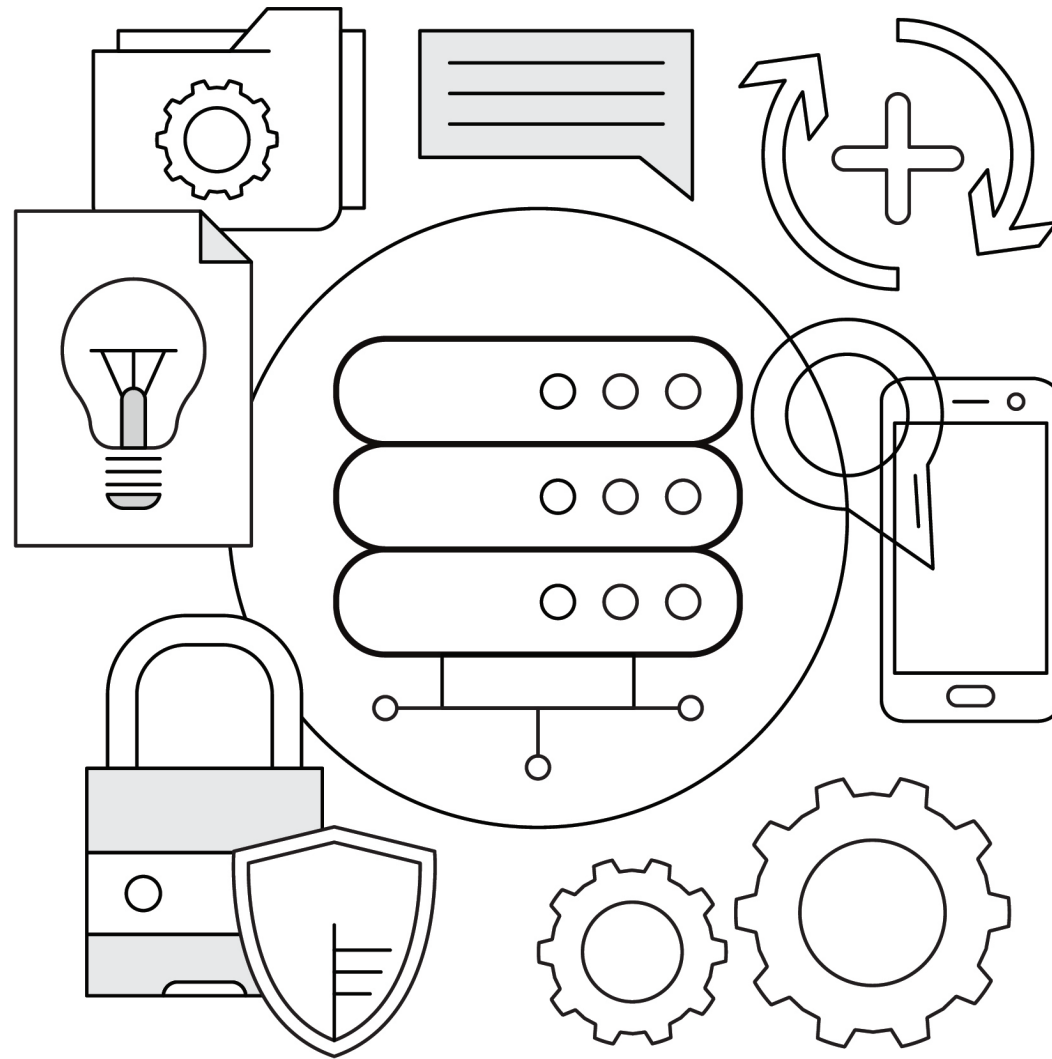

Pay Attention!

(IMAP)

IMAP stands for Internet Message Access Protocol. It is a program that is used to access incoming email. It stores email messages on a remote server, away from users, and then allows them to view and manage messages as if they were stored on their personal computer.

Exercise 1

Complete the following sentences:

- 1 Email is a means of exchanging digital throughor interconnected networks.
- 2 Instant messaging means the transmission of at the same time of sending them, while.....relies on and forwarding, andmessages can be saved in mailboxes for users to access at any time.
- 3 A protocol is rules and regulations that a particular process and using these enables us to organize the process of sending and of email messages between users.
- 4 There are three basic protocols currently in use, which are the SMTP system, the POP system, and thesystem.
- 5 The protocol is used for sending email, while the and are used for receiving email messages.

Pay Attention!

The (IMAP) protocol allows users to organize email messages into folders, mark messages for follow-up, and save draft messages on the server. Users can also take advantage of the protocol's features to show messages that have been read or that are still unread.

Instructions:

Read the sentences in the table carefully, start with the first sentence in column (A), and search in column (B) for the sentence that completes its meaning. Below is an example of the connection between two sentences.

Exercise 2

Match the terms from column (A) with their corresponding meanings in column (B):

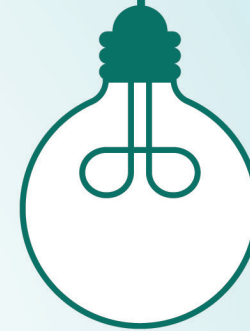

Column (A)	Column (B)
IMAP ☐	☒ The latest and specialized in receiving messages
The IMAP protocol is used for ☐	☐ Keeping messages in email without deletion
The IMAP protocol allows users to ☐	☐ Receive messages
The IMAP protocol helps with ☐	☒ Internet Message Access Protocol
The IMAP protocol is considered ☐	☐ Accessing the server and selecting the messages to be read

Pay Attention!

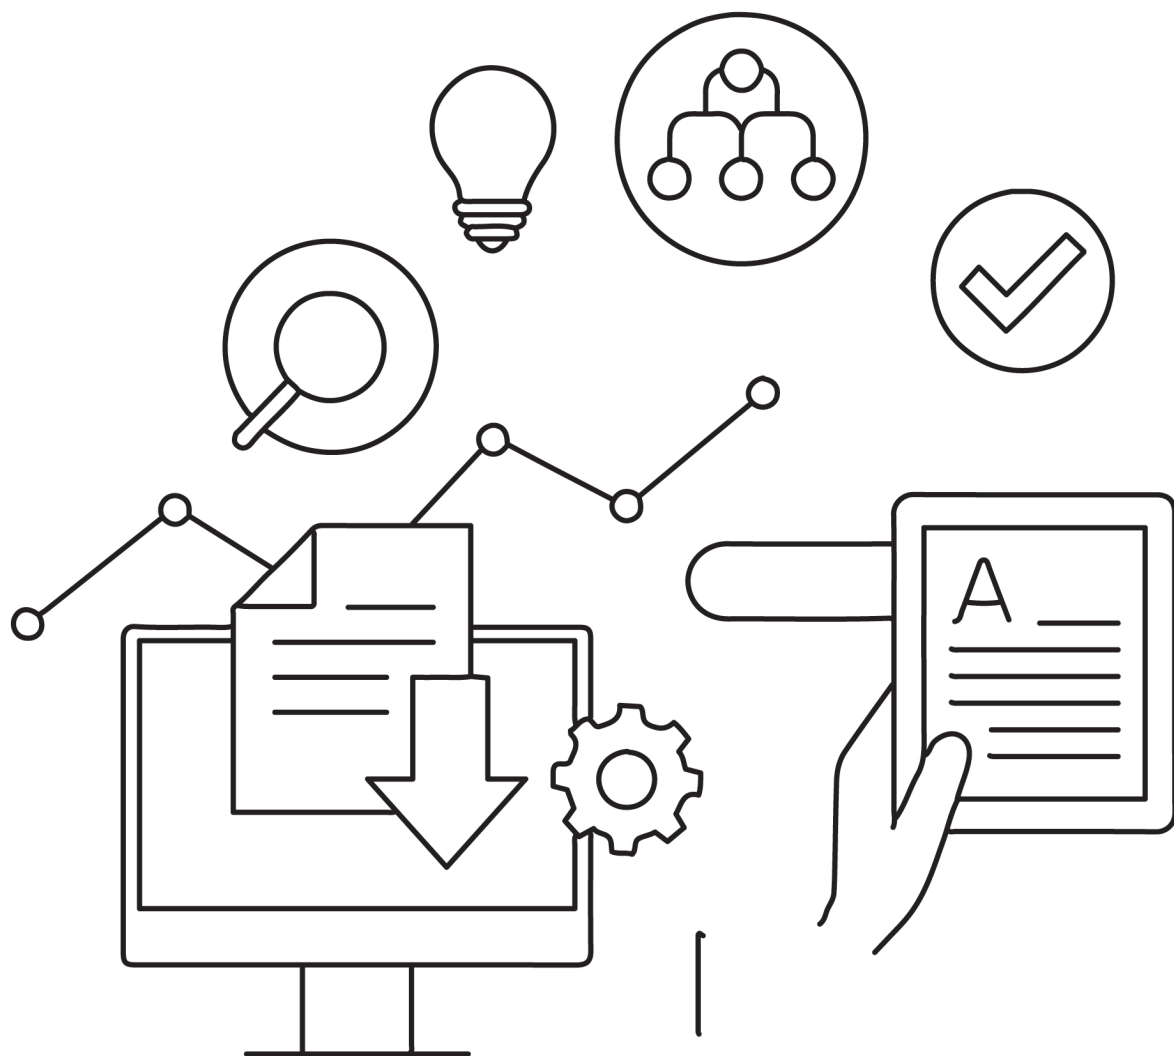

The (IMAP) protocol acts as an intermediary between the email server and the email user. This is done by reading the messages through the protocol outside of the server without the need to download or store email messages on their personal devices.

Do you know that...?

There are two types of HTTP messages: the request message and the response message.

Exercise 3

Mark (✓) or (✗) in front of the following sentences:

- 1 One of the important features of the IMAP protocol is that it allows users to access text messages. ☐
- 2 The IMAP protocol acts as an intermediary between email servers and email clients. ☐
- 3 The IMAP protocol saves you the trouble of downloading email messages from the server to the email client. ☐
- 4 The IMAP protocol allows users to access their email from any device. ☐
- 5 The IMAP protocol automatically updates itself when the user makes any changes to the files on the email. ☐
- 6 Users cannot access their email accounts when using a different device. ☐
- 7 The IMAP protocol and other protocols work to divide technical processes, preventing computers and servers from connecting to each other. ☐
- 8 The IMAP protocol is used to send email messages. ☐
- 9 The IMAP protocol is a paid protocol. ☐
- 10 You can only use the IMAP protocol on one device without others. ☐

Pay Attention!

Email Protocol

An email protocol is a program that connects one computer to another to exchange email messages.

Exercise 4

Complete the following sentences:

1

The main feature of IMAP is that it allows users to their messages from another

2

The IMAP protocol acts as an intermediary between the email and the email, instead of email messages from the server to client.

3

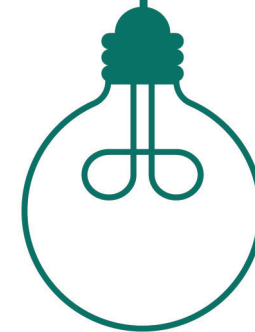

Through the protocol, users can access their email from any different without any problem.

4

IMAP protocol users do not need to connect to the same where they originally read the

5

The IMAP protocol is used for email messages.

Do you know that...?

All HTTP pages are stored in what is known as the page cache on the internet when you visit them for the first time, which makes loading the content faster when you visit the pages again.

Instructions:

Carefully read the sentences in the table and determine whether each sentence refers to the IMAP, SMTP, or POP3 protocols. An example provided below

Exercise 5

Identify which of the following sentences relate to the **IMAP** protocol and which ones belong to the **SMTP** and **POP3** protocols:

	Protocol Type
1.You can access your email messages from any device.	IMAP
2.Used to transfer simple mail from a local client to the recipient's address.	
3.Email messages can only be accessed from the device they were downloaded on.	
4.Email messages cannot be accessed in offline mode.	
5.Messages are downloaded into the device, which takes longer to display messages.	
6.Once downloaded, email messages are deleted from the server.	
7.Protects devices by filtering messages.	
8.The server stores email messages as intermediaries between the server and the client.	

	Protocol Type
9. Subject lines and sender names are quickly filled in email.	
10. The number of messages an account can send within a specific timeframe is regulated.	
11. Email messages can be accessed in offline mode.	
12. Message groups are not downloaded until the user clicks on them.	
13. Preserves the same storage space for emails by automatically deleting messages.	
14. Requires more server space as it does not automatically delete messages.	

Pay Attention!

Email Protocol

When sending an email, there are three elements in the exchange equation (two devices + server) ; One of the devices sends the email to the other (the recipient), while the mail server's task is to store the messages and allow the receiving device to access and download them when needed.

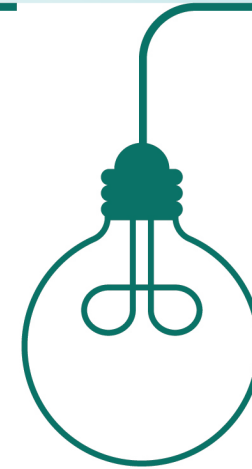

Exercise 6

Identify the true and false statements in the following sentences:

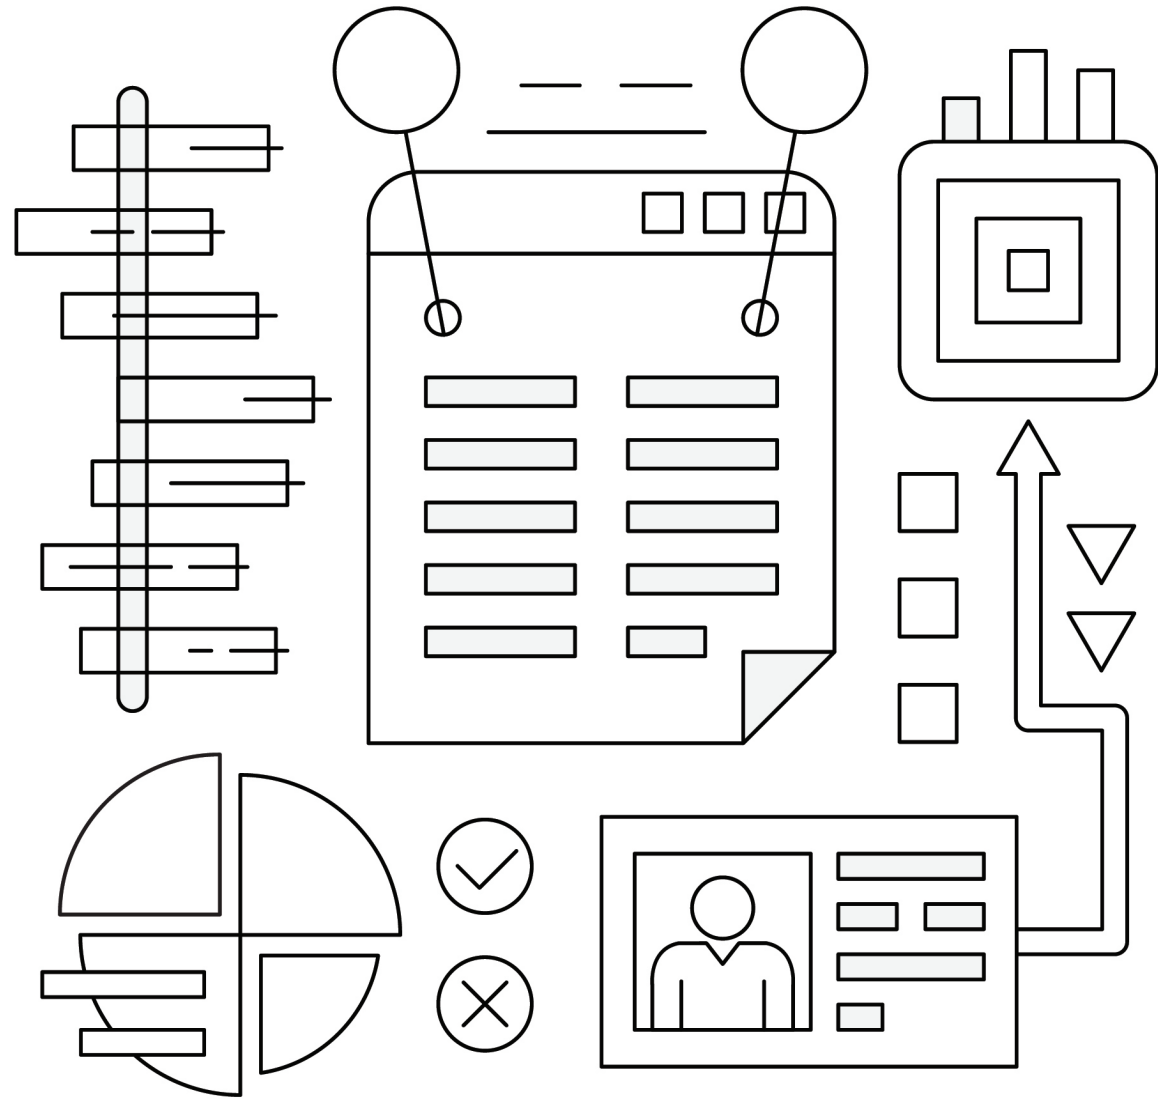

1	Users can access and read their email from any device.	false
2	Users can open email messages even when not connected.	
3	When a user logs into their email, the email server retrieves all their email messages.	
4	Email users cannot see any data related to the email until they open a message.	
5	Email deletes old messages periodically.	

Do you know that...?

To overcome the security concerns of protocol IMAP, you should use encryption, two-factor authentication, and strong passwords.

**IMAP
Protocol**

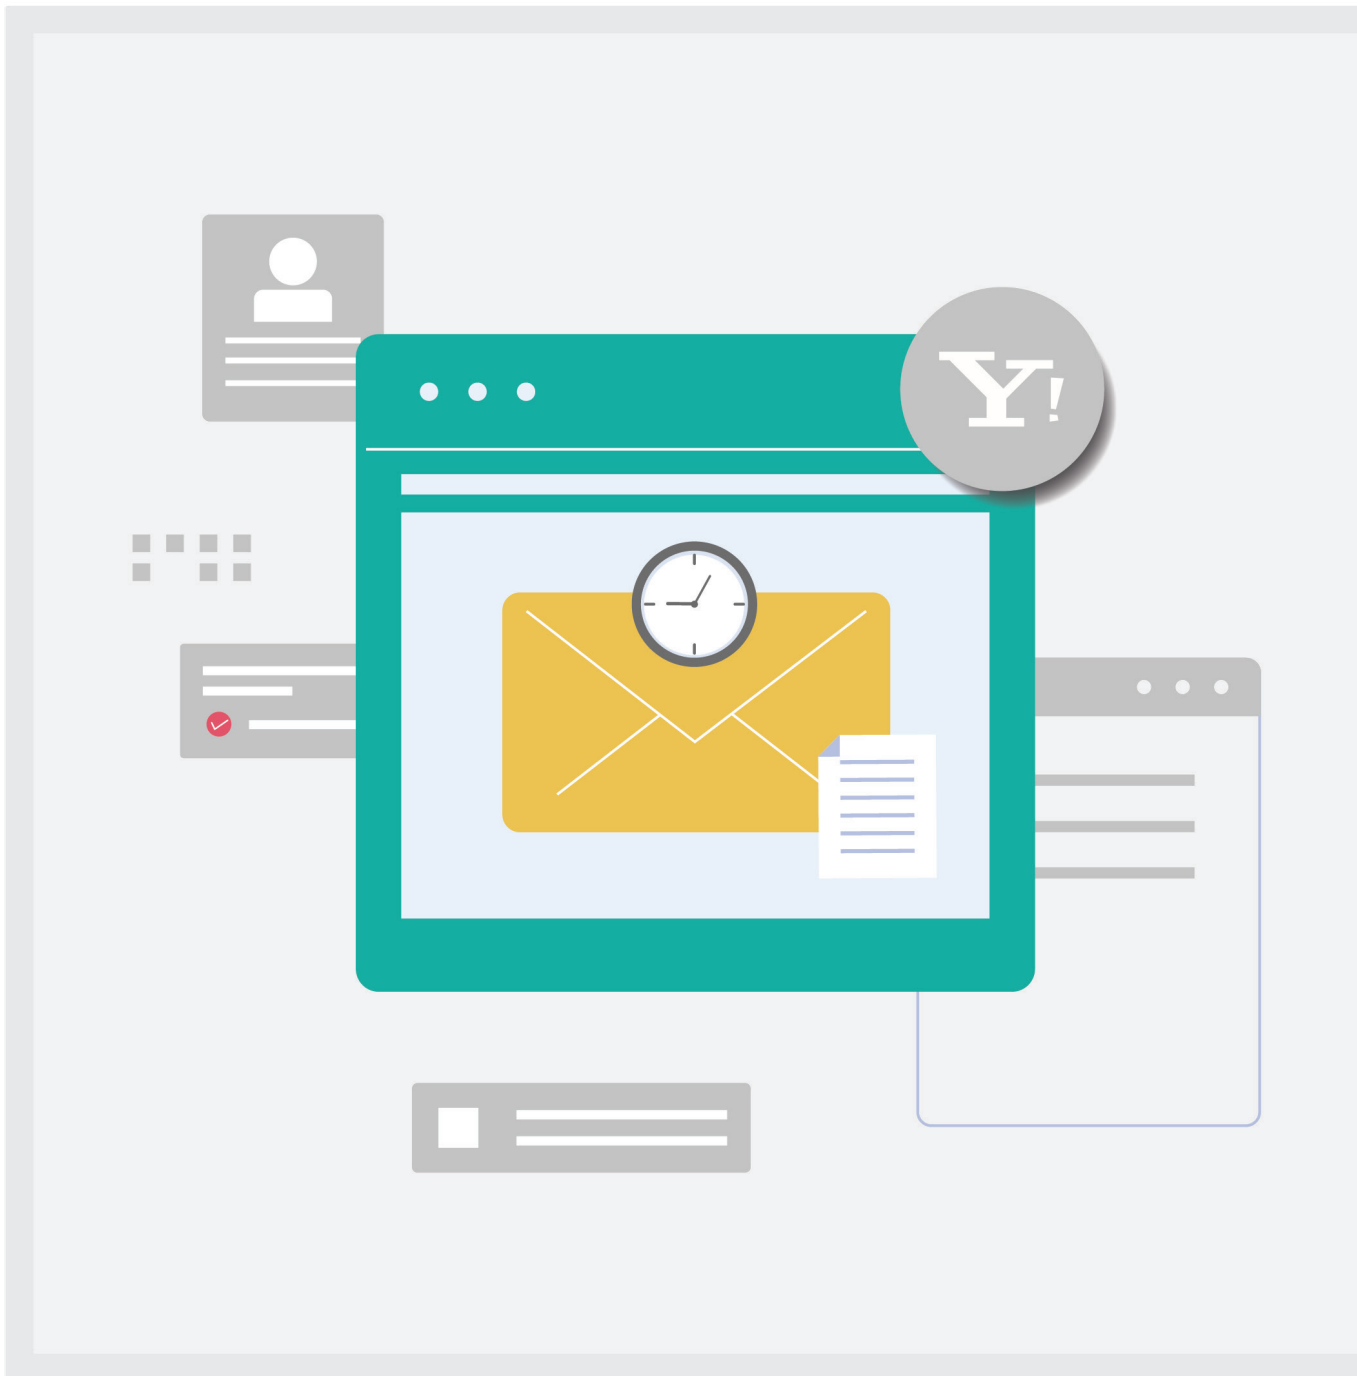

Exercise 1

**Write 3 features
for each of the
following:**

**POP
Protocol**

**SMTP
Protocol**

Pay Attention!

POP3 enables email users with temporary internet access to access their messages, read them, or compose new messages or reply to them even if they are not connected to the internet, and then send them when they reconnect to the internet. Examples of this type of email protocol include Yahoo.

The IMAP protocol supports users' access to their email messages, whether they are connected to the internet or not, just like POP3.Protocol.

Exercise 2

There is more than one fundamental security issues - three problems - in the operation of the IMAP protocol.
Could you discuss them and provide practical solutions?

3

2

1

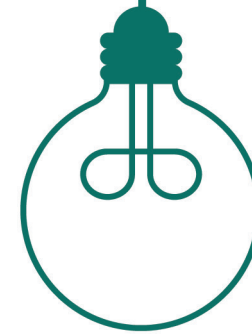

Pay Attention!

SMTP is a simple text-based protocol that works well when devices are connected to each other. It is only specific to sending email messages, unlike the protocol of both POP3 and IMAP, which provide message retrieval from the server. This is why reliance on it has declined.

Do you know that...?

Email consists of: sender, recipient, email address, Mailer, mail server, SMTP.

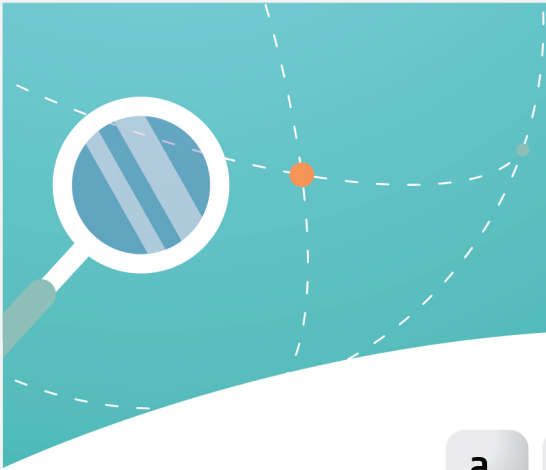

Pay Attention!

SMTP

One of the drawbacks of SMTP is the lack of email sender authentication, along with the absence of security features, leading to users receiving unwanted messages.

Instructions:

Read the words below carefully and search the table for consecutive letters that form these words. Below is an example of the word "**protocol**" and how to find its letters in the table:

Exercise 3

Extract the following words from the table.

a	s	v	e	p	r	o	t	o	c	o	l
s	e	t	t	i	n	g	s	p	o	r	t
a	r	c	h	i	v	e	e	r	a	s	e
m	e	s	s	a	g	e	s	b	l	k	s
i	n	b	o	x	w	h	s	e	n	t	y
s	t	o	r	a	g	e	n	m	o	v	e
d	e	v	i	c	e	d	e	l	e	t	e
e	m	a	i	l	b	u	s	e	r	s	a

~~Protocol~~ - Email - Messages-Users - Device- Settings- Inbox
Sent - Storage - Archive - Delete - Move - Port- Save - Erase

Pay Attention!

Email is an electronic communication method for sending and receiving messages over the internet, currently the most common form of communication. It features functionalities like synchronization and security, as well as features related to spam mail.

What is it ?

- A protocol that enables users to organize email messages in folders, mark messages for follow-up, and save message drafts on the server. Users can also display read or unread messages.
- It is a communication program between a computer and another to exchange email messages between them.
- Four different email protocols, in terms of features, uses, and importance.
- It is a simple and old protocol designed for use on a single computer, supporting only one-way synchronization of email..
- It is a simple text-based protocol that works well when devices are connected to each other, and only specializes in sending email messages.
- A protocol that enables users who use web browsers to access their email messages for sending or receiving, utilized by popular applications like Hotmail and Yahoo.
- It is responsible for sending, receiving, managing, and logging all the data that is done by its own E-mail programs, as well as processing them.

Mark (✓) or (✗) in front of the following sentences:

-  1 The IMAP protocol does not store email messages on a remote server away from users. ☐
-  2 IMAP enables users to organize email messages in folders, and mark messages for follow-up. ☐
-  3 IMAP users cannot access email messages from multiple devices. ☐
-  4 The POP3 protocol is ideal for those who need to access their email messages while traveling or using different devices. ☐
-  5 There are three similar mail protocols in terms of features, uses, and importance. ☐
-  6 The POP3 protocol allows email users who have temporary internet access to access their messages, read them, or compose new messages or reply to them when they are not connected to the internet. ☐

7

One of the advantages of protocol POP3 is the ability to store mail on users' personal devices.

8

One of IMAP's features is time-saving for email users as it allows them to search for email messages on the server.

9

IMAP Protocol does not allow logging in via multiple email users on computers or mobile devices and reading the same messages.

10

IMAP transmits data, including login information and email content in plain text, which increases the risk of exposing sensitive information to spying or external attacks.

11

The SMTP protocol uses the internet to send and receive messages, and is used by each user's mail program such as Yahoo .

Complete the following phrases.

- 1 Email consists of: _____, _____, _____, Mailer, _____, and SMTP.
- 2 When the sender uses the mail program, it is redirected to _____ which verifies the validity of the recipient's email address.
- 3 The protocol stores the sent email on the server for later transfer using any of the basic protocols _____.
- 4 In case the recipient has a different domain address (for example, the sender's domain Gmail differs from the recipient's domain Hotmail), protocol _____ connects with server _____ which communicates with the other address used by the recipient and then SMTP of _____ starts connecting with SMTP of _____ to deliver the email.
- 5 In case both _____ of the sender and recipient are unable to communicate with each other due to internet problems for example, the mail intended for delivery to the recipient is placed in a queue specific to protocol _____ until the problem is solved.
- 6 In case the recipient uses protocol _____, then the mail he receives is deleted from the web server copy, while in case of using _____, a copy of the email is stored on the web server for interaction at any time desired by the recipient.

- 7 An example of an online attack using protocol IMAP that affected users of in 2018.
- 8 To overcome security concerns from protocol IMAP, one should use, and, and strong and different.
- 9 Protocol causes more energy consumption as a result of using more system resources; therefore, it is not the best option for devicesthat contain wireless sensor networks.
- 10 All HTTP pages are stored within what is known as on the internet upon first visit, which makes loading content faster when visiting pages again.
- 11 There are two types of HTTP messages:, and
- 12 The user needs an address to access the desired document on the internet, here protocol HTTP uses ... to determine any type of information on the internet, where it defines four parts:, and,, and

Graduation Project

The graduation project is an assignment that you undertake on your own or in collaboration with one or two of your colleagues, under the supervision of the trainer. Through it, you are required to perform one of the following assignments:

Writing a short story about a student who asked for help from one of his friends to explain to him what is IMAP protocol, and how his friend provided him with the information, and how he helped him and enabled him to benefit from the protocol and understand its work and functions.

The student takes on the role of a trainer and writes general guidelines to his colleagues or parents explaining the concept and importance of the IMAP protocol.
